

UPoE

With the development of technology, the maximum power required by the PD access devices has increased, and the maximum power provided by the PoE standard 802.3at cannot meet the power requirements. PICA8 supports the Universal Power over Ethernet (UPoE) function to provide more power to the PD devices, including IP cameras, video servers, compact switches and IP phones, etc. For details of UPoE support on each PoE platform, see [set poe interface max-power](#).

You can use **set poe interface** {<port-id> | all} **max-power** <integer> command to set the maximum output power delivered by the PSE device.
